Problem 1

a) Formulating the problem as an discrete-time, infinite-horizon o. c. problem yields

$$
\begin{aligned}
\min_{u_0, u_1, \ldots} \quad & \sum_{k=0}^{\infty} f_0(x_k, u_k) = 0.9^k f_0(x_k, u_k) \\
\text{subject to} \quad & x_{k+1} = f(x_k, u_k), \\
& x_k \in \mathcal{X} = \{\xi_1, \ldots, \xi_8\}, \\
& u_k \in \mathcal{U} = \{0, 1, 2\}, \\
& x_0 = \xi_1,
\end{aligned}
\tag{1}
$$

where the dynamics $f : \mathcal{X} \times \mathcal{U} \longrightarrow \mathcal{X}$ are defined by the arrows in the graph.

The Value function iteration is defined by the Bellman operator

$$
V_{k+1}(x) = TV_k(x) = \min_{u \in \mathcal{U}}\{f_0(x, u) + \alpha V_k(x)\} \quad \text{with} \quad \alpha = 0.9.
\tag{2}
$$

Evaluated for this particular problem, this yields

$$
\begin{aligned}
V_{k+1}(\xi_1) &= \min_{u \in \mathcal{U}}\{1 + 0.9V_k(\xi_2), 1 + 0.9V_k(\xi_2)\}, \\
V_{k+1}(\xi_2) &= \min_{u \in \mathcal{U}}\{3 + 0.9V_k(\xi_7), 6 + 0.9V_k(\xi_5), 3 + 0.9V_k(\xi_4)\}, \\
V_{k+1}(\xi_3) &= \min_{u \in \mathcal{U}}\{1 + 0.9V_k(\xi_4), 2 + 0.9V_k(\xi_6), 3 + 0.9V_k(\xi_5)\}, \\
V_{k+1}(\xi_4) &= \min_{u \in \mathcal{U}}\{2 + 0.9V_k(\xi_7), 6 + 0.9V_k(\xi_8), 3 + 0.9V_k(\xi_6)\}, \\
V_{k+1}(\xi_5) &= \min_{u \in \mathcal{U}}\{0 + 0.9V_k(\xi_4), 0 + 0.9V_k(\xi_4), 1 + 0.9V_k(\xi_6)\}, \\
V_{k+1}(\xi_6) &= \min_{u \in \mathcal{U}}\{5 + 0.9V_k(\xi_1), 1 + 0.9V_k(\xi_7), 1 + 0.9V_k(\xi_8)\}, \\
V_{k+1}(\xi_7) &= \min_{u \in \mathcal{U}}\{2 + 0.9V_k(\xi_8), 2 + 0.9V_k(\xi_8), 2 + 0.9V_k(\xi_8)\}, \\
V_{k+1}(\xi_8) &= \min_{u \in \mathcal{U}}\{0 + 0.9V_k(\xi_8), 0 + 0.9V_k(\xi_8), 0 + 0.9V_k(\xi_8)\},
\end{aligned}
\tag{3}
$$

starting with an arbitrary inital value function $V^0 : \mathcal{X} \longrightarrow \mathbb{R}$.

b) Value function $V : \mathbb{R}^8 \longrightarrow \mathbb{R}$, obtained after 1000 value function iterations:

$$
\begin{aligned}
V(\xi_1) &= 3.61 \\
V(\xi_2) &= 4.80 \\
V(\xi_3) &= 2.90 \\
V(\xi_4) &= 3.80 \\
V(\xi_5) &= 1.90 \\
V(\xi_6) &= 1.00 \\
V(\xi_7) &= 2.00 \\
V(\xi_8) &= 0.00.
\end{aligned}
\tag{4}
$$

The values in (4) induce the following state feedback:

$$
\begin{aligned}
k(\xi_1) &= u_2 \\
k(\xi_2) &= u_1 \\
k(\xi_3) &= u_1 \\
k(\xi_4) &= u_1 \\
k(\xi_5) &= u_2 \\
k(\xi_6) &= u_2 \\
k(\xi_7) &= u_0 \\
k(\xi_8) &= u_0.
\end{aligned}
\tag{5}
$$

For the initial state $x_0 = \xi_1$, the state-feedback given in (5) yields the optimal input sequence

$$
u^* = \begin{pmatrix} 2 & 1 & 2 \end{pmatrix},
$$

that steers the state to the terminal state ξ_8 via the route $\xi_1, \xi_3, \xi_6, \xi_8$.

c) We suppose

$$
V^0(\xi) \le TV^0(\xi) \quad \forall_{\xi \in \mathcal{X}},
\tag{6}
$$

for an initial function V^0 for a value function iteration with the Bellman Operator, defined in (2). From the lectures, we have the following properties.

$$
\|TV^1 - TV^2\|_\infty \le \alpha \|V^1 - V^2\|_\infty
\tag{Contraction}
$$
$$
\tag{7}
$$

$$
V^1(\xi) \le V^2(\xi) \quad \forall_{\xi \in \mathcal{X}} \implies TV^1(\xi) \le TV^2(\xi) \quad \forall_{\xi \in \mathcal{X}}
\tag{Monotonicity}
$$
$$
\tag{8}
$$

V^* solves the Bellman Equation V^* is the Value function, since we have discounted costs. (9)

First we show, that the iteration converges to the value function of the problem. Since (7) holds and $\alpha \in (0,1)$,we deduce the convergence of $\{V_k\}_{k \in \mathbb{N}}$ by the Banach-Fixed-Point-Theorem. Since we have such a limit $\lim_{k \to \infty} V_k \longrightarrow V^*$, it has to satisfy the fixed point property $TV^* = V^*$. Hence it satisfies the Bellman equation and (9) verifies V^* as the value function of our problem.

Second, it remains to show that $V^0(\xi) \le V^*(\xi) \forall_{\xi \in \mathcal{X}}$ holds.
By assumption (6) and the monotonicity property (8), we infer inductively, that $V_k(\xi) \le V_{k+1}(\xi)$ for all $\xi \in \mathcal{X}$. Thus, the sequence $\{V_k(\xi)\}_{k \in \mathbb{N}_0}$ is non-decreasing for any $\xi \in \mathcal{X}$. This proves the claim $V^0(\xi) \le V^*(\xi) \forall_{\xi \in \mathcal{X}}$.

d) Maximization Problem:

$$
\max_{V(\xi_1),\dots,V(\xi_n)} \quad \sum_{k=0}^{n} V(\xi_i)
\tag{10}
$$
$$
\text{subject to} \quad V(\xi_i) \le TV(\xi_i) \quad \forall_{i=1,\dots,n}.
$$

To show: V^* is a solution to the maximization problem given above. Proof by contradiction. Suppose, there exists an admissible Function $\tilde{V} : \mathbb{R}^n \longrightarrow \mathbb{R}$ with

$$
\tilde{V}(\xi_i) > V^*(\xi_i)
\tag{11}
$$

for at least one $i \in \{1,\dots,n\}$. Since $\tilde{V}$ is admissible for the given max. problem, we know that $\tilde{V}(\xi_i) \le T\tilde{V}(\xi_i) \quad \forall_{i \in \{1,\dots,n\}}$. From excercise c) we know, that hence $\tilde{V}(\xi_i) \le T^k\tilde{V}(\xi_i) \le V^*(\xi_i)$ holds for all $i \in \{1,\dots,n\}$ and for all $k \in \mathbb{N}$. This clearly contradicts (11). Thus, V^* maximizes the objective of the given problem.

e) Transform (10) into

$$V^* = \underset{V(\xi_1),\ldots,V(\xi_n)}{\arg \max.} \quad \sum_{k=0}^{n} V(\xi_i)$$

$$\text{subject to} \qquad V(\xi_i) \le f_0(\xi_i, u) + \alpha V(f(\xi, u))$$

$$\forall_{u \in \mathcal{U}(\xi_i)} \forall_{i=1,\ldots,n}. \tag{12}$$

As shown in d), V^* maximizes the objective of problem (10). It remains to show, that the constraints of problems (10) and (14) are equivalent. The operator T is defined by the Bellman Equation, as written in (2). We have

$$V(\xi_i) \le TV(\xi_i) = \min_{u \in \mathcal{U}} \{ f_0(\xi_i, u) + \alpha V_k(\xi_i) \}$$

$$\le f_0(\xi_i, \tilde{u}) + \alpha V_k(\xi_i) \tag{13}$$

for any input signal $\tilde{u} \in \mathcal{U}$. This arises directly from the definition of the minimum. Thus, (10) and (14) denote the same problem.

It remains to formulate this as a linear program

$$V^* = \underset{V(\xi_1),\ldots,V(\xi_n)}{\arg \max.} \quad \sum_{k=0}^{n} V(\xi_i)$$

$$\text{subject to} \qquad V(\xi_i) \le f_0(\xi_i, u) + \alpha V(f(\xi, u))$$

$$\forall_{u \in \mathcal{U}(\xi_i)} \forall_{i=1,\ldots,n}. \tag{14}$$

Problem 2

a)

b)
